# XSL-FO の実践

XSL-FO in practice

**Where Is XSL-FO Used?** 5

**Journal Publishing: JATS and PLOS ONE** 14

**References** 38

Appendix A – **About** 39

## XSL-FO の実践

1

- Introduction
- Where is XSL-FO used?
- Case study: JATS and PLOS ONE

おはようございます。私はグラハムトニーです。どうぞよろしくおねがいたします。

## Who am I?

2

- XML, XSLT, and XSL-FO consulting
- Print and Page Layout Community Group Chair
- W3C Invited Expert
  - XSL 1.0 CR to Recommendation
  - After XSL 1.1 to end
- Japanese Language Task Force (English side)
- Previously ran XSL-List and DSSSList
- Antenna House Alliance Partner
- Lived in Japan 1991-1995

(CR = Candidate Recommendation, which is two stages before becoming a Recommendation)

## Where Is XSL-FO Used?

3

My experience includes:

- Conference proceedings
- Automotive maintenance information
- Aircraft manuals
- General publications
- Journals

But no one person has the full picture...

## What Is The Shape Of XSL-FO Today?

4

“Blind monks examining an elephant”, an ukiyo-e print by Hanabusa Itchō.

In the Buddhist version of this parable, the blind men come to blows when they can't agree, but I hope we're not going to do that today.

## Two World Views

5

- “**CSS clearly and decisively won on the web**, and XSL-FO is being shuttered as a W3C technology, with us absorbing Liam for his expertise in printing tech (which XSL-FO was always somewhat better at) so we can bring CSS up to rough feature parity”
- “Just today I visited my car dealership to pick up my car, my propane tank was filled, I had a doctor's appointment and FedEx delivered a few packages. **Everyone of them resulted in pages of documentation in print. Much of it probably from XSL FO sources** (I happen to know two of them were definitely).”

But while, in late 2012, a member of the CSS WG talked about the end of XSL-FO on the web, in late 2013, a representative of a formatter vendor was upbeat about the number of places that XSL-FO is used off the web.

## Announcements, 2013 – www-xsl-fo@w3.org

6

- February – XSLFast

www-xsl-fo@w3.org is the W3C mailing list specific to XSL-FO, and the introduction of the spec directs people there, so the single announcement in 2013 on www-xsl-fo@w3.org would indicate that there's not much activity in XSL-FO land.

## Announcements, 2013 – vendor websites

7

- February – Ecrion
- April – Compart
- June – **Antenna House**
- July – Ecrion
- August – Ecrion, RenderX
- September – **Antenna House**
- October – **Antenna House**, Compart, Altova
- November – **Antenna House**
- December – Ecrion, **Antenna House**

However, away from the developer's mailing list, multiple vendors made multiple product announcements on their own websites during 2013.

The announcements indicate activity, but at best the activity is visible only to each vendor's customers and to those who actively look for it.

## Print & Page Layout Community Group Survey

8

- Introducing the Community Group
- Survey and results

Another viewpoint can be had from the profiles of the people who responded to a survey run by the Print & Page Layout Community Group at W3C.

## Print & Page Layout Community Group

9

“The Print and Page Layout Community Group is open to all aspects of page layout theory and practice. We can and will cover everything from the Crystal Goblet through to specifications and on to the nitty-gritty of writing stylesheets. You will find XSL-FO discussed here, but you will also find other stylesheet languages, and all are equally welcome.”

The current group description on the Print & Page Layout Community Group web page.

## History

10

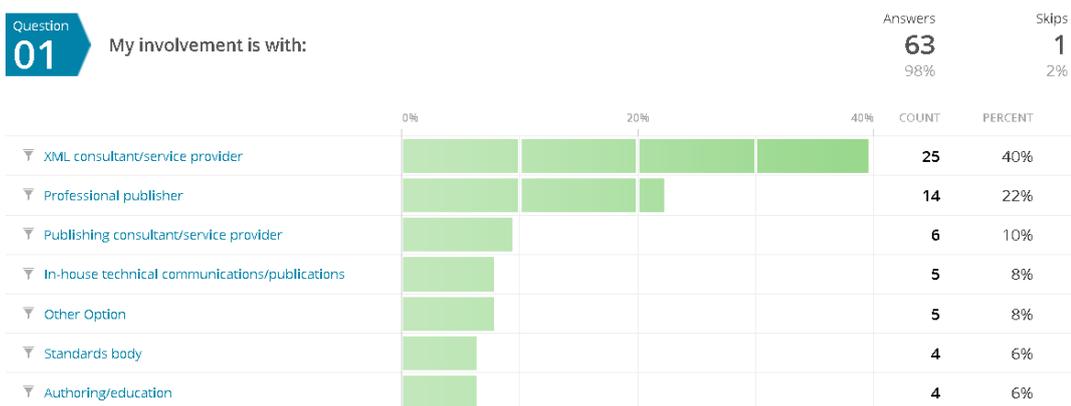

- Started after XML Prague 2012
- Survey on “What to do next?” in January 2014
- Survey advertised on XSL, XSL-FO, XML, and CSS mailing lists, and on Twitter
- 64 responses
  - Twice as many as W3C XSL-FO requirements survey in 2008
- Look at responses about current usage

The Print & Page Layout Community Group started out focused on XSL-FO, but re-examined its priorities towards the end of 2013. As part of that, the CG ran a survey on “What to do next?” and advertised it widely on mailing lists and Twitter.

The initial questions in the survey sought information about the person responding, while later questions covered what to do next. The responses to the initial questions, therefore, can give a picture of the XSL-FO usage among those who responded.

## Involvements With Markup

11

This first question asked what people were involved with.

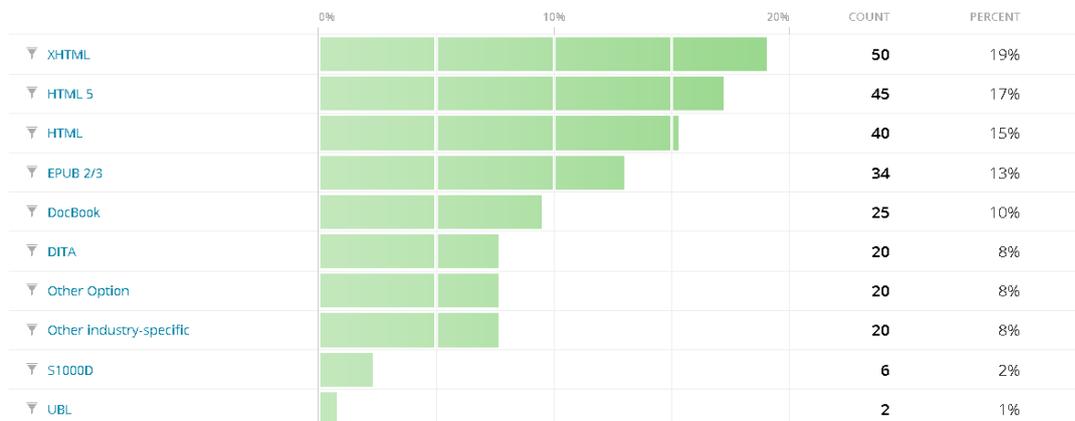

Responding was voluntary, so it's not surprising that many responders were already involved with XML, though nearly a third were primarily involved with publishing.

## Standards In Use

12

Question  
02

Markup-related standards I use include:

Answers  
**64**  
100%Skips  
**0**  
0%

The second question asked what markup-related standards people used. Multiple responses were allowed on this question.

Most people use multiple forms of HTML, and more than half use EPUB.

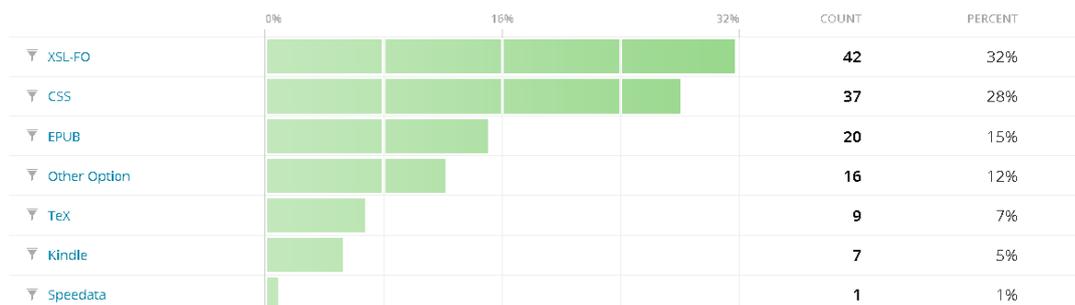

It's likely also that the people using DocBook, etc., are transforming their XML to make HTML and EPUB.

## “Print” Technology

13

Question  
03

I 'print' using:

Answers  
**64**  
100%Skips  
**0**  
0%

The third question asked what technologies people are using and provided a mixed selection of technologies to choose from, as well as an “other option” option.

Multiple responses were also allowed on this question, and on average the responders selected two technologies.

XSL-FO was the most used technology among the responders, which we know were mostly XML professionals and professional publishers. CSS usage wasn't far behind, but while many people must have selected both XSL-FO and CSS, there unfortunately wasn't a question about relative proportions of the usage of both technologies.

## Output Format

14

Question

04

My 'print' output is:

Answers

64

100%

Skips

0

0%

	0%	28.5%	57%	COUNT	PERCENT
▼ Mostly paginated output				36	56%
▼ Paginated output only				15	23%
▼ Mostly unpaginated or reflowable output				9	14%
▼ Unpaginated or reflowable output only				4	6%
▼ None				0	0%

The next question asked about the format of the output, with the implication that it was produced using the technologies selected in the previous question.

Although in the previous question more than half of the responders said they use CSS, the responders were mostly (and for nearly a quarter, exclusively) producing paginated output.

Unfortunately, there wasn't a question about which technologies were used for paginated output, so we don't know the balance between XSL-FO usage and CSS usage.

## Interests In Activities

15

Question  
05

My interest in ... is as ...

Answers

64

100%

Skips

0

0%

	SPECIALIST	GENERALIST	NOVICE	INTERESTED BYSTANDER	UNINTERESTED
Page layout	29	28	4	0	0
Single source/multiple outputs	39	18	4	1	1
XML	53	6	0	0	1
HTML/XHTML/HTML 5	33	26	5	0	0
CSS	20	36	5	1	0
XSL-FO	23	17	5	8	6
Digital Publishing	30	19	8	2	2
Writing software	25	23	4	8	1
Standards development	15	20	5	20	1

The final survey question that's useful for today asked people to rate themselves for their level of interest in multiple areas.

This is a "temperature graph" for what people were interested in. Multiple answers were allowed for this question.

From what we know from the first question on involvement, it's not surprising that most people described themselves as an XML expert.

The large number of programmers also doesn't reflect the general population, but the number may include people counting XSLT as their programming specialty.

More than half the responders identified themselves as CSS generalists, but there was more of a divide for XSL-FO between specialists and people who were uninterested or a bystander.

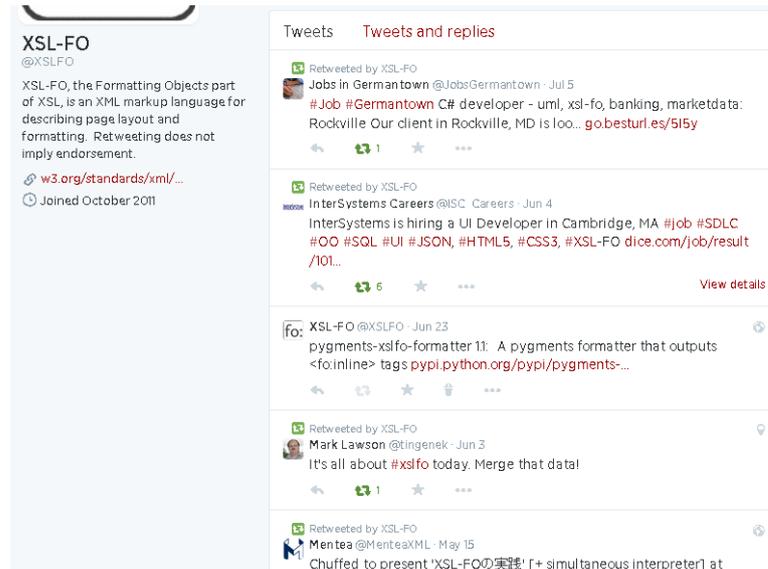

## Summary: PPL CG Survey

16

- XML professionals and publishers are producing mostly paginated output
- XSL-FO is of interest to people interested in print & page layout
- More people use it than consider themselves experts in it

## XSL-FO On Twitter

17

The @XSLFO Twitter account retweets mentions of XSL-FO.

There's usually one job posting a month or so.

Number of followers growing steadily but still not large

## DITA and XSL-FO

18

"I think that the DITA-OT community is the largest user group for FOP. If you look at LinkedIn, the DITA awareness group has 552,722 members, the DITA for Small Teams has 64,551 members, DITA Metrics has 74,388. There are country-specific DITA groups with 15-20,000 members. The Tools for Change for Publishing has 3,175,059 members. DITA Machine Industry for technical docs for automotive and machinery has 18,463 members. DITA-OT including FOP has been downloaded 344 times this week and over 4,100 times in the last 12 months."

I don't know if we're up to the tail of the elephant or the ears, but the next three slides are extracts of recent email messages discussing XSL-FO usage.

This first one is from a message to the fop-dev mailing list in March 2014 from Ron Wheeler, a member of the DITA-OT community.

## Aircraft Maintenance and XSL-FO

19

"For my previous employer I was producing 30,000 pages a month with less than \$2000 worth of software."

This is from a message from Michael Hahn to the Print & Page Layout Community Group mailing list in December 2013 referring to his previous job in Technical Publications for a light-aircraft manufacturer where he used XSL-FO to produce thousands of pages per month.

## Publishing and XSL-FO

20

“XSL-FO is very, very widely used in professional publishing; the largest publishers use XSL-FO (and in some cases XHTML + CSS) for most of their fiction and mainstream texts. There are relatively few publishers using it, but between them they produce most of the books you see - although there's much more diversity in Europe than in the USA in that regard.”

This last one is from Liam Quin of W3C to the XSL-List mailing list in May 2014 on a thread discussing XSL-FO usage for professional publishing.

## Summary: Shape Of XSL-FO Today?

21

- No-one has the complete picture
- Many use its output without knowing
- More run XSL-FO than are experts

We have seen a variety of views. Information about XSL-FO usage isn't available all in one place, and information such as new product announcements isn't widely disseminated. We saw from the Print & Page Layout CG survey that while some people are XSL-FO experts, there are others who aren't, so that while there are many downloads of the DITA Open Toolkit, many more will use the XSL-FO processor in the toolkit than will modify the XSL-FO. Similarly, there are many more people using the books or maintenance manuals produced using XSL-FO than use an XSL-FO processor.

## Questions?

22

質問がありますか。

**A Single Kernel-Based Approach to Extract Drug-Drug Interactions from Biomedical Literature**

Yi Li, Hongyi Luo, Zhong Wang, Jian Wang, Yanyang Li

**Abstract**

Drug-drug interactions (DDIs) are a major cause of adverse drug reactions. Identifying DDI is important for patient safety. However, manual extraction of DDI from biomedical literature is time-consuming and error-prone. In this paper, we propose a single kernel-based approach to extract DDI from biomedical literature. The proposed approach is based on the assumption that the DDI-related information is distributed in a similar manner in the text. We use a single kernel to capture the DDI-related information. The proposed approach is evaluated on a DDI dataset. The results show that the proposed approach outperforms the state-of-the-art methods.

**Introduction**

Drug-drug interactions (DDIs) are a major cause of adverse drug reactions. Identifying DDI is important for patient safety. However, manual extraction of DDI from biomedical literature is time-consuming and error-prone. In this paper, we propose a single kernel-based approach to extract DDI from biomedical literature. The proposed approach is based on the assumption that the DDI-related information is distributed in a similar manner in the text. We use a single kernel to capture the DDI-related information. The proposed approach is evaluated on a DDI dataset. The results show that the proposed approach outperforms the state-of-the-art methods.

In this half of the presentation, I will talk in general about journal publishing from XML using JATS and then talk specifically about work done formatting articles for the PLOS ONE journal.

## What is JATS?

24

<http://jats.nlm.nih.gov/>

- Journal Article Tag Suite
- For STM journal articles
  - Related “BITS” schema for STM books
- Used by journal publishers and archives around the world
- Successor to “National Library of Medicine (NLM) Journal Archiving and Interchange Tag Suite”

The NLM Tag Suite project was started by the National Center for Biotechnology Information (NCBI) at NLM in 2002 as the schema for articles submitted to PubMed. When usage of the NLM Tag Suite grew to be more than just for submitting to PubMed, the Tag Suite moved to the NISO standards organisation, and the name changed to “Journal Article Tag Suite” to better reflect the wider usage.

(“STM” = “Scientific, Technical, and Medical”)

## Who Uses JATS?

25

- Over 2 million XML articles in PubMed Central (in 2011)
- Nature
  - Announced two Open Access journals in January 2014
- International Standards Organisation (ISO)
  - ISO Standards Tags Set (ISO STS) is an adaption of JATS
- Optical Society of America
  - Converted 95 years of legacy journal content to XML
- Substance Abuse and Mental Health Services Administration (SAMHSA), USA
  - Source for printed and mobile versions of publications
- 学術情報 XML 推進協議会
  - XML Scholarly Publishing Association (XSPA)
- Public Library of Science (PLOS), USA
  - Open Access journals

## What Colour is Your JATS?

26

Three models for different stages in life of an article:

- **Article Authoring Tag Set**
  - For authoring well-structured articles
  - Very prescriptive, no generated content
- **Journal Publishing Tag Set**
  - What you'd accept for publishing
  - Restrictive, limited options
- **Journal Archive and Interchange Tag Set**
  - The output of a published article or where you have no control over content
  - Most permissive

The JATS Tag Suite defines three “tag sets” that you can use as-is or use as the base for your own customisation of JATS. The tags sets each cover a different stage in the life of an article, and they are commonly referred to by their identifying colour: orange, blue, or green.

(The difference between “tag suite” and “tag set” isn't all that obvious even to English speakers.)

## address in Article Authoring Tag Set

27

```
((institution | institution-wrap)*, addr-line*, country, phone*, fax*, email*, ext-link*, uri*)
```

- Fixed order of elements
- Requires one country

We'll look now at the address element to illustrate the differences between the tag sets.

The Orange tag set is designed to enable structured authoring.

address in the Article Authoring Tag Set requires its elements in a certain order and requires that country is always part of the address.

## address in Journal Publishing Tag Set

28

(`addr-line` | `country` | `fax` | `institution` | `institution-wrap` | `phone` | `email` | `ext-link` | `uri`)\*

- Same elements allowed
- No fixed order
- Zero or multiple of everything okay
- Allows multiple country

In the Journal Publishing Tag Set, the same elements are allowed, but there's no restrictions on order or occurrence of the elements. The Blue tag set is more what you'd accept for a publishing process where you have less control over the content to be published. The blue highlights in the content model show the differences from the Orange tag set.

## address in Journal Archive and Interchange Tag Set

29

(`addr-line` | `country` | `fax` | `institution` | `institution-wrap` | `phone` | `email` | `ext-link` | `uri` | `label` | `x`)\*

- Same elements in any order and any number
- Additional elements:
  - `label` – “Label (of an Equation, Figure, Reference, etc.)”
  - `x` – “X - Generated Text and Punctuation”

The Journal Archive and Interchange Tag Set is just as relaxed, and it also allows `label` and `x` for representing generated content – such as figure numbers, etc. – that was added as part of the publishing process. The green highlights in the content model show the extra elements allowed in the Green tag set.

## JATS Preview Stylesheets

30

<https://github.com/NCBITools/JATSPreviewStylesheets>

- XSLT 1.0
- Public domain
- No copyright issues
- Developed for NCBI by Mulberry Technologies

## Customizability

33

“These stylesheets are **provided as a point of entry for JATS users** who may not have the resources to create them from scratch. Because there are many varied implementations of JATS, you should have no expectation that these stylesheets will create production ready files in any arbitrary system. Instead, the stylesheets should be customized for your particular needs.”

“Because **we view these stylesheets as a template for a customized solution, not the solution itself**, we will accept changes that fix an actual bug, but we will not merge in changes that we view as “customization”. For example, we will accept changes that fix a problem which otherwise leads to failure in creating a final output file, but we will not accept changes that focus on presentational aspects of the final output (such as font changes, margin changes, graphics sizing, etc).”

Statement about customisation from JATSPreviewStylesheets README with added emphasis.

## XSLT features supporting customizability

34

- Templates
- Modular stylesheets
- Named attribute sets

## Templates

35

- `match` matches a context in source XML
- Content of `xsl:template` instantiated when template is applied

```
<xsl:template match="td">
  <fo:table-cell xsl:use-attribute-sets="td">
    <xsl:call-template name="process-table-cell"/>
  </fo:table-cell>
</xsl:template>
```

Elements in the body of the template not in the XSLT namespace are copied to the result, and elements and attributes in the XSLT namespace are acted on by the XSLT processor.

## Modular stylesheets

36

```
<xsl:include
  href = uri-reference />
```

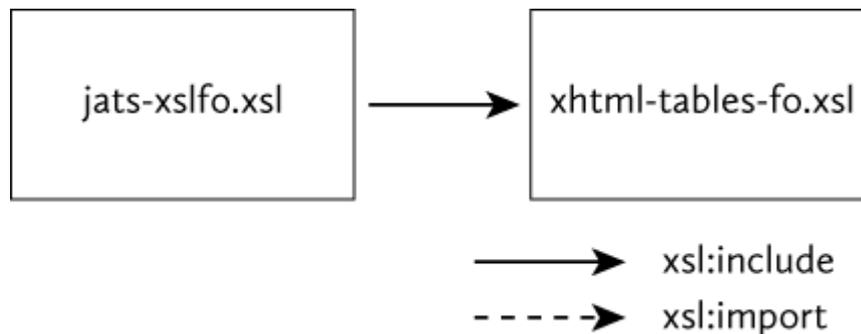

- href refers to other stylesheet
- Children of other `xsl:stylesheet` replace `xsl:include`

```
<xsl:import
  href = uri-reference />
```

- href refers to other stylesheet
- Imported definitions and template rules *not* part of importing stylesheet
- Have lower *import precedence*

## Imports in JATS XSL-FO preview

37

There a more interesting block diagram later.

## Overriding templates

38

- Template in importing stylesheet overrides same context in imported
- Good when overriding complete function of template
- Extra overhead if you just want to change one little thing

## Attribute sets

39

- Named set of attribute definitions
- Use in multiple places
- Definitions evaluated in each context where used

```
<xsl:attribute-set name="fig">
  <xsl:attribute name="keep-together.within-page"
    >always</xsl:attribute>
  <xsl:attribute name="id">
    <xsl:value-of select="generate-id()" />
  </xsl:attribute>
</xsl:attribute-set>
```

Since attribute definitions in attribute sets are evaluated each time the attribute set is used, the value of the `id` attribute will be unique to each context.

## JATS Preview supporting customizability

40

- Global variables
- Attribute sets
- Named templates

## Example customization

41

- Add to attribute set from JATS stylesheets

```
<xsl:attribute-set name="td">
  <xsl:attribute name="line-stacking-strategy"
    >max-height</xsl:attribute>
</xsl:attribute-set>
```

- New attribute set reusing merged td attribute set

```
<xsl:attribute-set name="td-small"
  use-attribute-sets="td">
  <xsl:attribute name="line-height">10pt</xsl:attribute>
  <xsl:attribute name="border">none</xsl:attribute>
  <xsl:attribute name="padding-top">0pt</xsl:attribute>
  <xsl:attribute name="padding-bottom">0pt</xsl:attribute>
</xsl:attribute-set>
```

- Override JATS stylesheet in more-specific context

```
<xsl:template
  match="td[ancestor::table[@style = 'small']]">
  <fo:table-cell xsl:use-attribute-sets="td-small">
    <xsl:call-template name="process-table-cell"/>
  </fo:table-cell>
</xsl:template>
```

The `xsl:attribute-set` extends the 'td' defined in the JATS Preview stylesheet.

The new 'td-small' attribute set includes the attribute definitions from all declarations for the 'td' attribute set plus the definitions contained in its definition.

The template matches on a more-specific context than the general-purpose template for `td` in the JATS Preview stylesheets, so in those particular contexts, the XSLT processor uses this template, which adds a different set of attributes to the generated `fo:table-cell` but which still uses the 'process-table-cell' named template from the JATS Preview stylesheets as is used in the original template for `td`.

This illustrates in a nutshell how a customisation is able to extend, override, and reuse the constructs in the core JATS Preview stylesheets.

## Summary: JATS Preview

42

- XSLT 1.0
- Not accepting customisations into core
- Stylesheet structure facilitates customisations

## Summary: JATS

43

- Three tags sets for different stages
- JATS Preview stylesheets:
  - Explicitly don't support customisation
  - Good basis for your own customization
- Customise by:
  - Layer on top of existing styleheets
  - Modify your copy of the stylesheets

- Peer-reviewed, open-access, online publication
- Public Library of Science
- JATS/NLM markup
- Lights-out batch formatting with XSL-FO
- Previously produced use 3B2 and (presumably) manual fix-up
- XSLT 2.0 because...
  - Big differences in metadata, figure, table handling
  - Needed vendor extensions
- Customisation...
  - Modified version of `jats-xslfo.xsl`
  - Additional XSLT modules

The image displays a grid of 12 sample pages from PLOS ONE, illustrating the output of XSL-FO formatting. The pages are arranged in a 3x4 grid. Each page shows a different type of content:
 

- Page 1 (top-left):** Article title "A Single Kernel-Based Approach to Extract Drug-Drug Interactions from Biomedical Literature" with authors and abstract.
- Page 2 (top-middle):** Figure showing multiple line graphs (A-H) with axes labeled "Number of interactions" and "Time".
- Page 3 (top-right):** Table with columns for "Year", "n", "CI", "CI", "CI", "CI", "CI", "CI" and rows of data.
- Page 4 (middle-left):** Table with columns for "Year", "n", "CI", "CI", "CI", "CI", "CI", "CI" and rows of data.
- Page 5 (middle-middle):** Diagram showing a flowchart of a process with boxes labeled "Input", "Process", and "Output".
- Page 6 (middle-right):** Table with columns for "Year", "n", "CI", "CI", "CI", "CI", "CI", "CI" and rows of data.
- Page 7 (bottom-left):** Table with columns for "Year", "n", "CI", "CI", "CI", "CI", "CI", "CI" and rows of data.
- Page 8 (bottom-middle):** Diagram showing a flowchart of a process with boxes labeled "Input", "Process", and "Output".
- Page 9 (bottom-right):** Table with columns for "Year", "n", "CI", "CI", "CI", "CI", "CI", "CI" and rows of data.

**PLOS ONE “Features”**

46

- Figures and tables float to top (or bottom) of page
- Figures column-wide or page-wide
  - No size information in XML
- Figure graphic+caption can't overflow page
- Tables column-wide, page-wide, or page-high
  - Page-high may be single column
  - May be multiple pages
  - No width indication in XML
  - No row spanning (thank goodness!)
- No figures or tables allowed after start of back matter

**XSLT/XSL-FO “Features”**

47

- Page-wide floats
  - Vendor extension for column-wide
- Floats don't break
- Floats only at top of page
  - Bottom-float extension available but unused
- Graphic size not available to XSLT
- *Fire-and-forget* processing

# Floats in Sample PLOS Pages

The image displays six individual page screenshots from a PLOS ONE article, arranged in a 2x3 grid. Each screenshot shows a different section of the page, with green rectangular boxes highlighting specific areas where text or graphics have floated out of their intended positions. The sections shown include:

- Top Left:** The abstract and introduction sections, with green boxes highlighting lines of text that have shifted or wrapped incorrectly.
- Top Middle:** A figure with multiple subplots, where green boxes highlight parts of the plots that are not aligned with the figure's bounding box.
- Top Right:** A table with several columns and rows of data, with green boxes highlighting cells that have shifted or are cut off.
- Bottom Left:** A large table with many columns and rows, with green boxes highlighting various cells across the table.
- Bottom Middle:** A diagram or flowchart showing a process flow, with green boxes highlighting parts of the diagram that are misaligned.
- Bottom Right:** The conclusion section, with green boxes highlighting lines of text that have floated.

The green areas show floats in the sample PLOS ONE pages.

# Using Antenna House Float Extensions

The image displays six screenshots from PLOS ONE articles, illustrating various table and figure representations. Orange boxes highlight specific elements that can be represented using float extensions in Antenna House Formatter. The text overlaid on these areas illustrates the extension properties and their values.

- Top Left:** A table with columns and rows. An orange box highlights a cell with the text `axf:float-reference="column"`.
- Top Middle:** A diagram showing a flow or process. An orange box highlights a section with the text `axf:float-reference="column"`.
- Top Right:** A table with columns and rows. An orange box highlights a section with the text `axf:float-reference="column"`.
- Middle Left:** A table with columns and rows. An orange box highlights a section with the text `axf:float-y="bottom"`.
- Middle Middle:** A diagram showing a flow or process. An orange box highlights a section with the text `axf:float-reference="column"`.
- Middle Right:** A table with columns and rows. An orange box highlights a section with the text `axf:float-reference="column"`.
- Bottom Left:** A table with columns and rows. An orange box highlights a section with the text `<fo:table reference-orientation="go" height="90mm">`.
- Bottom Middle:** A diagram showing a flow or process. An orange box highlights a section with the text `float="before"`.
- Bottom Right:** A table with columns and rows. An orange box highlights a section with the text `float="before"`.

The orange areas highlight the floats in PLOS ONE that can be represented using the float extensions in Antenna House Formatter. The text overlaid on the areas illustrate the extension properties and their values.

# Table Handling

- “Pre-format” tables in three widths on *long* pages
  - Column-wide, page-wide, (width of) page-high
  - Prefix table IDs with string indicating width
- Format to area tree XML
- Compare area trees for each table
- Use width with least area and no overflow
- Recreate as multiple `fo:float` if overflows page
  - Re-use table column widths from area tree to remain consistent

# Picking "Best" Tables

**Table 1. Statistics of the DDI corpus.**

Category	Training sets	Dev sets	Test sets
Document	230	160	80
Paragraph	1,107	790	395
Section	1,000	700	350
Text	1,100	790	395

**Table 2. Effectiveness of parameter.**

Parameter	P	R	F	AP	ACC	AUC
0	0.62	0.64	0.63	0.51	0.57	0.57

## Usual Processing Model

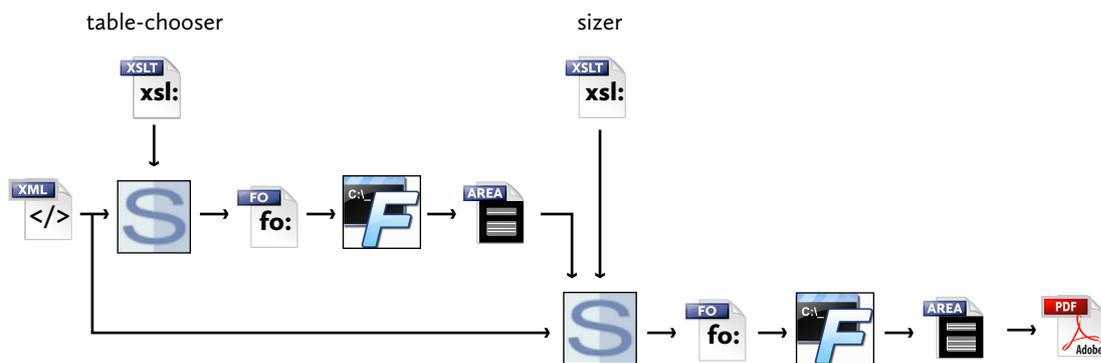

54

The conventional XSLT–XSL-FO processing model.

## Table-handling Processing Model

55

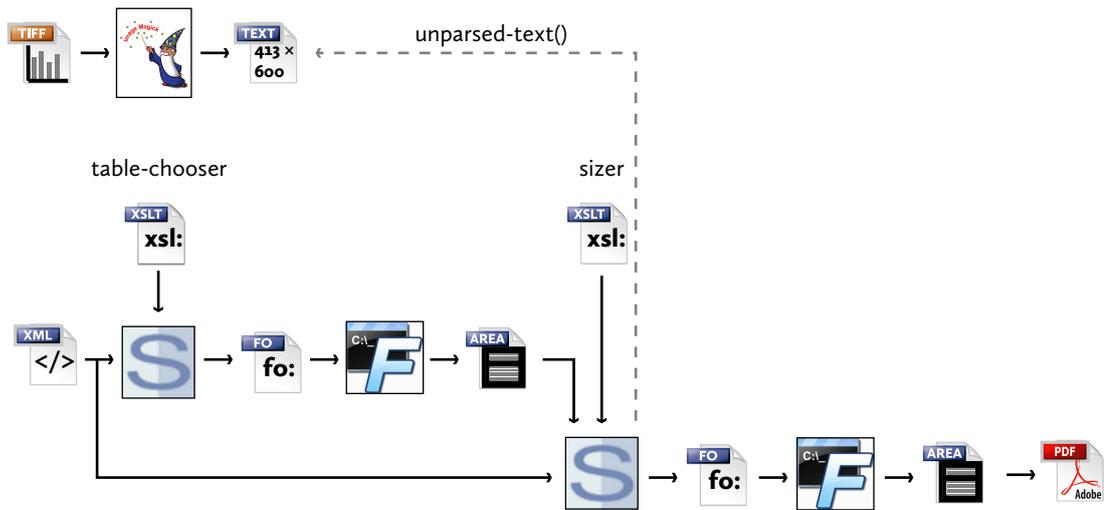

The processing model including preprocessing tables to generate an area tree from which to determine the preferred width for each table.

## Graphics Handling

56

- Get TIFF graphics
- ImageMagick identify gives graphic size and resolution
- “Pre-format” caption at both widths to get exact size
- Choose best width
- (Possibly) scale down graphic so caption also fits on page

# Figure-handling Processing Model

Processing model when graphics handling added.

# Floater After Back Matter

Figures and tables are required to not appear after the start of the back matter.

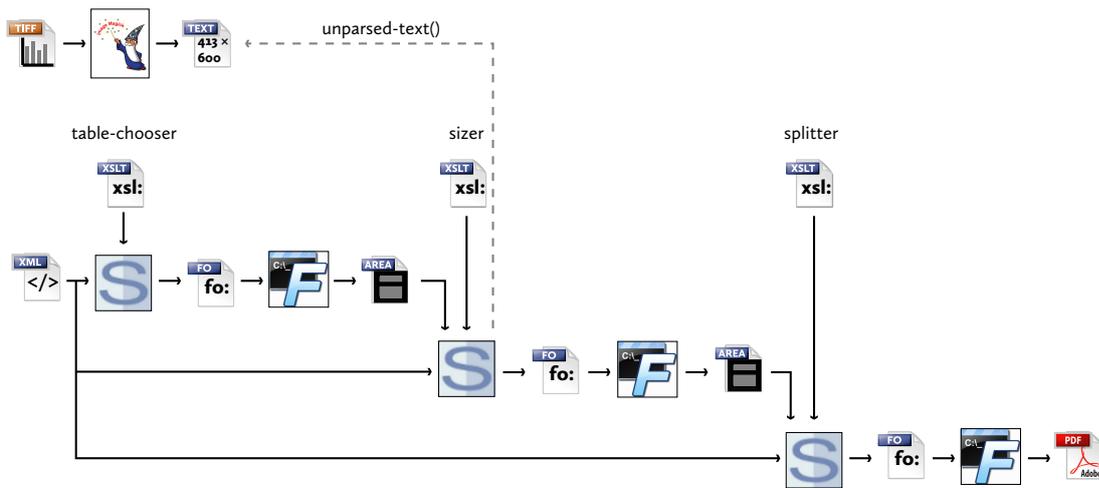

## Splitting at Back Matter

59

- Format “final” FO with right-width tables and figures to area tree
- Compare positions of first “back” content and last float
  - back plus bits from front, body
- Generate new FO with either one or two fo:page-sequence
- If second fo:sequence, it contains only back matter so floats in first appear before back matter

## Putting It All Together

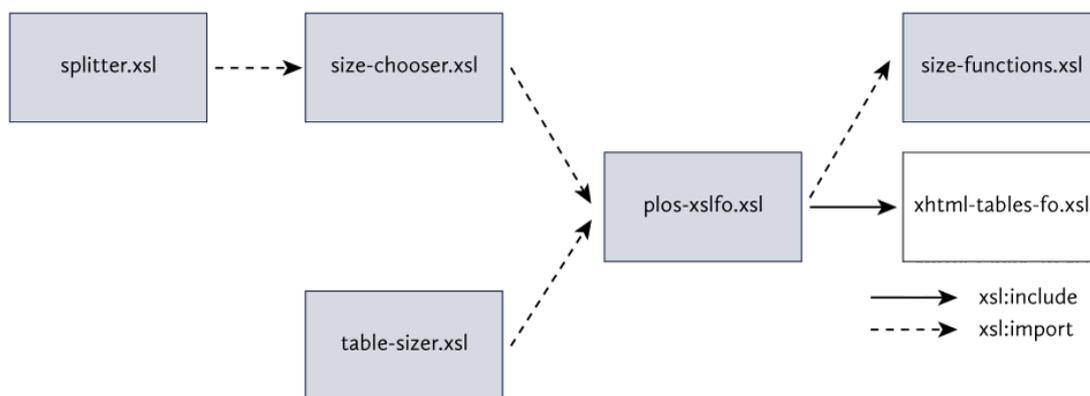

60

The full processing model.

## Import structure

61

All the top-level stylesheets use plos-xslfo.xsl for basic formatting.

splitter.xsl does everything size-chooser.xsl does, and more, so it imports that file rather than importing plos-xslfo.xsl directly.

## Other Features

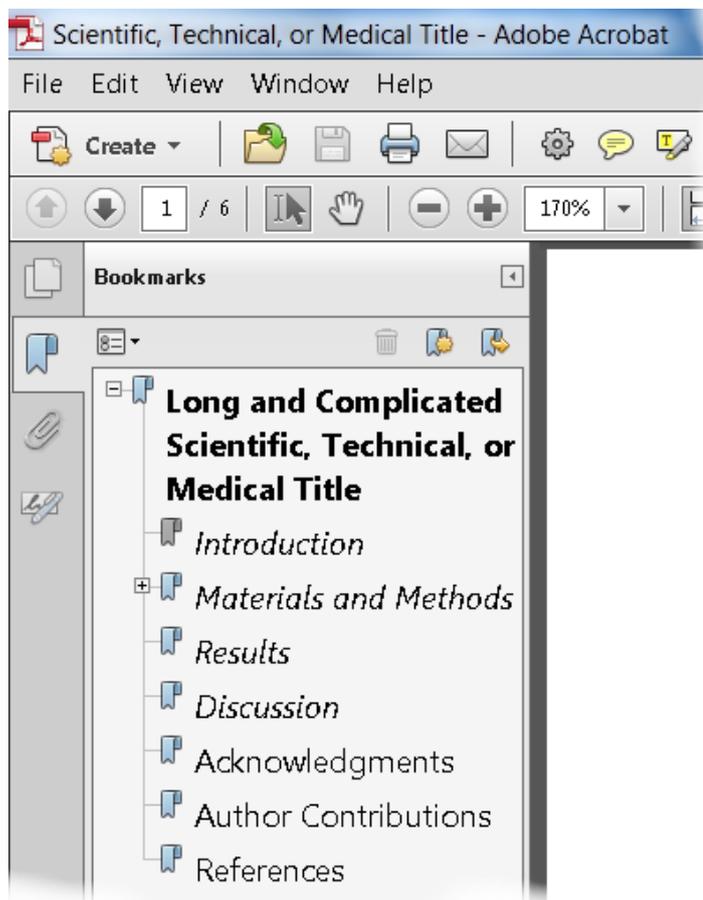

62

- Table of contents and document properties
- Rearranging article metadata

## Table of contents and document properties

63

- Bookmarks
  - XSL 1.1
- PDF properties
  - Title, etc. in PDF file
  - Antenna House extension

Formatting objects of bookmarks, which can be used to generate bookmarks in PDF, are part of XSL 1.1.

Setting PDF properties, such as the document title that can show in the banner of the PDF viewer, required a vendor extension, however.

## Rearranging Article Metadata

64

```

<article-title>Long and Complicated...
...

Here are some of the elements in the `article-meta` from a sample article alongside the rendering of the article metadata and abstract from the article. I'll be using these to illustrate the sorts of the rearrangements that you need to do to present the information to the reader.

Note that the abstract is towards the end of the `article-meta` in JATS, so there's already some selecting and rearranging going on for you to see it in its position on the page.

## Reusing article-title

65

```

<article-title>Long and Complicated...
...
<contrib deceased="yes">
  <name>
    <surname>Doe</surname>
    <given-names>John</given-names>

The `article-title` is, of course, presented at the top of the article, but it's also reused when multiple parts of the `article-meta` are pulled together to make the citation.

Either the `article-title` or an `alt-title` is also used for the running head at the top of each of the following pages.

## Reusing and Remodelling Authors

**Editor:** Peter Jones, School of Hard Knocks, University of Life

**Received:** October 1, 2010; **Accepted:** December 14, 2010; **Published:** January 20, 2011

This article is in the public domain.

**Funding:** This researchers were supported by sealing.

**Competing interests:** The authors have declared that no competing interests exist.

\* E-mail: utcobby@example.edu

† These authors contributed equally to this work.

‡ Current address: Department of Folklore, School of Life

† Deceased.

‡ These authors also contributed equally to this work.

The information about each of the contributors – who could have roles other than just author – is in the XML in a form that's easy to check.

The names are presented one way in the list of authors and another way in the citation, and neither way is exactly the same as in the XML. In the authors' names in the generated citation, the text of each given-name has been processed to be just the initials without any punctuation.

The "deceased="yes"" for John Doe triggers both the "†" after the name and the inclusion of either a specific "deceased" footnote from the `article-meta`, if it exists, or the standard text note for a deceased author if it doesn't.

You can't see it from the screenshot, but in the PDF, the superscript numerals after the author names are each a link to the corresponding affiliation.

## Reusing and Rearranging Dates

67

As you might expect by now, the dates for when the article was received, accepted, and published are in the XML in a form that's useful for checking and processing, and are presented in a form that's meant for reading. And only the year from the pub-date is used in the generated citation.

## Putting It All Together

68

```

I've shown you only some of the reordering and transforming that goes on to present the article metadata, but you can see that it's quite possible to rearrange what's in the XML into the format that you want to present to the reader.

## Checking Output

69

- Work with PDF
  - Ruler in PDF reader or Illustrator
  - Export as RTF (YMMV)
  - Paste into word processor to check fonts and sizes (YMMV)
- Open in FO processor application
  - Antenna House
- xmlroff testing module
- Antenna House Regression Testing Framework (AHRTS)

Checking your output isn't a separate phase, since you should be doing this all the way through.

## AHF GUI Preview

70

The screenshot shows a document preview with a ruler at the top. The document title is "Long and Complicated Scientific, Technical, or Medical Title". The authors are "John Smith<sup>\*</sup>, John Doe<sup>†</sup>, U. T. Cobby<sup>†¶</sup>". The document is from PLOS ONE. A text area is highlighted in blue, and its properties are shown in a yellow box:

```

TextArea
font-family='Arial, "DejaVu Sans", "Lucida Sans Unicode", "TW-Kai", "MS PGothic", OpenSymbol, sans-serif'
font-name='Arial Bold'
display-font='Arial'
font-weight='700'
font-size='10pt'
line-height='14pt'
x-height='0.518555'
script='Latin'
color='#000000'
width='63.3398pt'
text-width='63.3398pt'
writing-mode='lr-tb'
direction='ltr'
  
```

The text area contains the following text:

**Abstract**  
Lorem ipsum, etc.

**Citation:** Smith J, Doe J, Cobby UT (2011) Long journal.pone.0016390  
**Editor:** Peter Jones, School of Hard Knocks, Univ  
**Received:** October 1, 2010; **Accepted:** December  
This article is in the public domain.  
**Funding:** The researchers were supported by ses  
**Competing interests:** The authors have declared  
<sup>\*</sup> E-mail: utocobby@example.edu

The Antenna House GUI application can be useful for showing text properties and for measuring distances. It would be even more useful, however, if it could also show the formatted sizes of areas.

# xmlroff Testing Module

71

- Works with any command-line XSL processor
- Compares current results against reference
- Summary and individual HTML reports
- “Stereo” view of differences

## PLOS ONE testsuite results

Full	Issues	Total
6	0	6
100%	0%	100%

0 tests with differences

**xmlroff Test Suite** [Top]

**PONE** [Top]

pone.0047568	Full	PDF 8
pone.0055261	Full	PDF 11
pone.0055305	Full	PDF 9
pone.0055510	Full	PDF 7
test.table-overflow-height	Full	PDF 17
test.table-page-high	Full	PDF 18

I like to use the xmlroff Testing Module, since I wrote it.

# Antenna House Regression Testing System (AHRTS)

72

AHRTS is able to run on two PDFs or two directories of PDFs and produce a PDF report of differences between the files.

**Summary: PLOS ONE**

73

- Hard but doable
- Column-wide floats require vendor extension
- Needed multiple passes and access to area tree
- Navigating area tree isn't easy
- No standard for area tree XML made it harder and even less portable
- Creating new FO and reprocessing easier than rewriting area tree
- EXPath Binary Module (and a TIFF-handling library!) could avoid using ImageMagick
  - Or use vendor extension

## Appendix A About

Tony Graham (トウニー グラハム) のプロフィール 39

Mentea (メンテア) 会社のプロフィール 39

### Tony Graham (トウニー グラハム) のプロフィール

トウニーグラハムは 1991 年よりマークアップ言語、1996 年より XML、1998 年より XSLT/XSL-FO に取り組む。旧 XPPL (XSL-FO 仕様策定のための W3C の XML 印刷・ページレイアウト WG) に参加。現在は W3C の印刷とページレイアウト・コミュニティ議長、著名な XSLT 専門家、xmlroff という XSL-FO プロセサを開発、“Unicode: A Primer”の著者です。さらに XSLT の XSpec と Juxy テスティング続けて色々なトレーニングをしています。

トウニーの XML と SGML の職業歴史は日本、アメリカ、イギリス、アイルランドを含む。英語や中国語や日本語や韓国語など学問・自動車・出版・ソフトウェア・通信に利用するという事です。XML、XSLT、XSL-FO、EPUB、色々なテクノロジーについて北アメリカやヨーロッパやオーストラリアな会議でお客さんとも話しあいました。

Tony Graham has been working with markup since 1991, with XML since 1996, and with XSLT/XSL-FO since 1998. He is Chair of the Print and Page Layout Community Group at the W3C and previously an invited expert on the W3C XML Print and Page Layout Working Group (XPPL) defining the XSL-FO specification, as well as an acknowledged expert in XSLT, developer of the open source xmlroff XSL formatter, a committer to both the XSpec and Juxy XSLT testing frameworks, the author of “Unicode: A Primer”, a member of the XML Guild, and a qualified trainer.

Tony’s career in XML and SGML spans Japan, USA, UK, and Ireland, working with data in English, Chinese, Japanese, and Korean, and with academic, automotive, publishing, software, and telecommunications applications. He has also spoken about XML, XSLT, XSL-FO, EPUB, and related technologies to clients and conferences in North America, Europe, and Australia.

### Mentea (メンテア) 会社のプロフィール

MENTEA は XML や XSL-FO や XSLT など相談とトレーニングを提供しています。国際的の会議とトレーニングに加えて、電子メールやスカイプやインスタント・メッセージや電話などでお客さんと連絡を保つ。安全な wiki トラッキングシステムも利用してしています。

MENTEA のスタッフは 1991 年よりマークアップ言語、1996 年より XML、1998 年より XSLT/XSL-FO に取り組む。アイルランドのダブリンに位置しているのですが、世界的なお客さんを支えています。アメリカ・アイルランド・イギリス・フランスの会社と団体を助けて、色々なサービスを提供する。

MENTEA のサービス :

- XSLT, XSL, XML トレーニング。
- プロフェッショナルの団体のために Schematron を書くという。
- XSLT で作った自動的な schema 書類システム (HTML と PDF を制作したシステム) を増えるという。
- ソフトウェア会社のために FOP を発展する。
- XML、oXygen、DocBook、XSLT 2.0、XSL-FO のトレーニング。
- 科学のジャーナルのために JATS のフォーマットは PDF に変わるという。

- XSLT スタイルシートを製作して、XML ではないスタイルシートは XML に変えて、また EPUB に変える。
- 商業銀行のために XSLT を製作して EXCEL は XML にかえります。

MENTEA は特別の特殊な技術を供給する。XML と XSL-FO/XSLT ではなく (Unicode ・ SGML ・ DSSSL ・ C プログラム ・ Java ・ Perl ・ Lisp) 色々な言語もできる。

マークアップはよく理解してしています。日本やアメリカやイギリスやアイルランドなどマークアップ利用しています。ユーザー、相談者、開発者として、データは英語・フランス語・中国語・日本語・韓国語で色々な (学問・自動車・出版・ソフトウェア・電話・インターネットサービス・ドキュメントプロセッシング) 使い方があります。

また、多くの道具 (ユニットテスト・コードわたる・プロファイリング・を使って、ソフトウェアの良質を安全にできます。

複雑か特別なプロジェクトがあるばいは、世界中の相談者達と団体を手伝いを頼む。

Mentea specialises in consulting and training in XML, XSL-FO, & XSLT. We are available for on-site meetings and classes, worldwide, but as well as on-site meetings and classes, we routinely keep in touch with clients though email, Skype, instant messaging, and telephone and through a secure, per-client or per-project wiki, revision-control, and issue-tracking system.

Our staff have been working with markup since 1991, with XML since 1996, and with XSLT/XSL-FO since 1998. Based in Dublin, Ireland, Mentea has a global reach: in recent projects, we have helped companies and organisations in the USA, Ireland, England, and France with their XSLT, XSL, and XML, including:

- Writing Schematron for a professional body
- Augmenting a XSLT-based automated schema documentation system that produces both HTML and PDF
- Extending FOP for a software company
- Training in XML, oXygen, DocBook, XSLT 2.0, and XSL-FO
- Formatting JATS to PDF for a scientific journal
- Writing XSLT stylesheets to convert non-XML into XML then into EPUB
- Writing XSLT to convert Excel into XML for a commercial bank

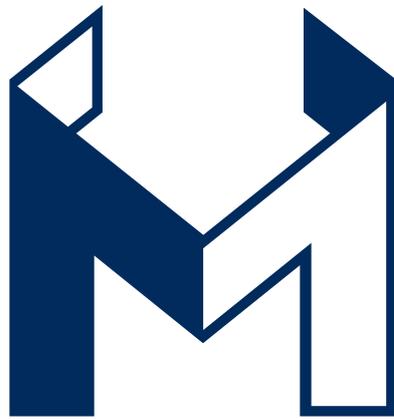

Mentea presents a unique range of skills extending beyond XML and XSL-FO/XSLT into Unicode, SGML, DSSSL, and programming in C, Java, Perl, Lisp, and other languages.

We understand how markup works. Our staff has worked with markup in Japan, USA, UK, and Ireland as user, consultant, and developer, with data in English, French, Chinese, Japanese, and Korean, with academic, automotive, publishing, software, and telecommunications applications, and in the Web Services and document processing arenas.

We are also interested in applying the tools for ensuring software quality – unit testing, code coverage, profiling, and other tools – to XML and XSLT/XSL-FO processing.

Through our associations and affiliations with other consultants around the world, we can call on extra help for large or specialised projects.

**MENTEA**
